Cuite: Qt 5 bindings for OCaml

Frédéric Bour

November 8, 2017

Qt?

- A C++ framework for Desktop and Mobile apps

Qt?

- A C++ framework for Desktop and Mobile apps
- Abstracting "platforms":
  (stdlib, **windowing system**, **GUI**, VFS, networking, "XML", …)

Qt?

- A C++ framework for Desktop and Mobile apps
- Abstracting "platforms":
  (stdlib, **windowing system**, **GUI**, VFS, networking,
  "XML", …)
- Cross-platform:
  Linux (X11, Wayland, Android), macOS, iOS, Windows,
  Blackberry, Sailfish OS, …

Used by KDE

```

Mapping Qt concepts to OCaml

Qt concepts for data representation:

- plain types (QString, int, float, ...)
- enumerations and flags
- object hierarchies and QObjects
- QVariants

Plain types

- Don't affect memory graph
- Are pure values (physical identity irrelevant)
- Mapped to a concrete OCaml type:

```
void bla(const QString& str);
val bla : string -> unit
```

- Or to an abstract type & a set of functions:

```
val QModelIndex.row : qModelIndex qt -> int
```

Enumeration

Enumeration are directly mapped to a polymorphic variant.

```
enum QStandardPaths::LocationOption {
  LocateFile,
  LocateDirectory
};

type qStandardPaths'LocationOption = [
  | `LocateFile
  | `LocateDirectory
  | `Invalid_value of int
]
```

Flags

Flags are unions of elements from an enumeration. They are manipulated with a generic module and a witness for each flag type.

```
type 'flag set
val define : ('flag -> int64) -> 'flag set

type 'flag t = private int64
val empty : _ t
val set : 'flag set -> 'flag -> 'flag t -> 'flag t
val is_set : 'flag set -> 'flag -> 'flag t -> bool

...
```

Flags

Flags are unions of elements from an enumeration. They are manipulated with a generic module and a witness for each flag type.

```
type 'flag set
val define : ('flag -> int64) -> 'flag set

type 'flag t = private int64
val empty : _ t
val set : 'flag set -> 'flag -> 'flag t -> 'flag t
val is_set : 'flag set -> 'flag -> 'flag t -> bool

...
```

Object hierarchy

Qt has a few **object hierarchies** and restricts it single inheritance the majority of the time.
OCaml encoding preserves the **single inheritance** (the **subtyping** relation is transported).
Multiple inheritance has to be dealt with manually.

Object hierarchy

```
(* All qt objects are instances of this scheme *)
type -'a qt

(* QObject is the root of most Qt objects *)
type qObject = [ `QObject ]

(* A QWidget is a QObject *)
type qWidget = [ `QWidget | qObject ]

(* Typechecks ! *)
(some_widget : qWidget qt :> qObject qt)

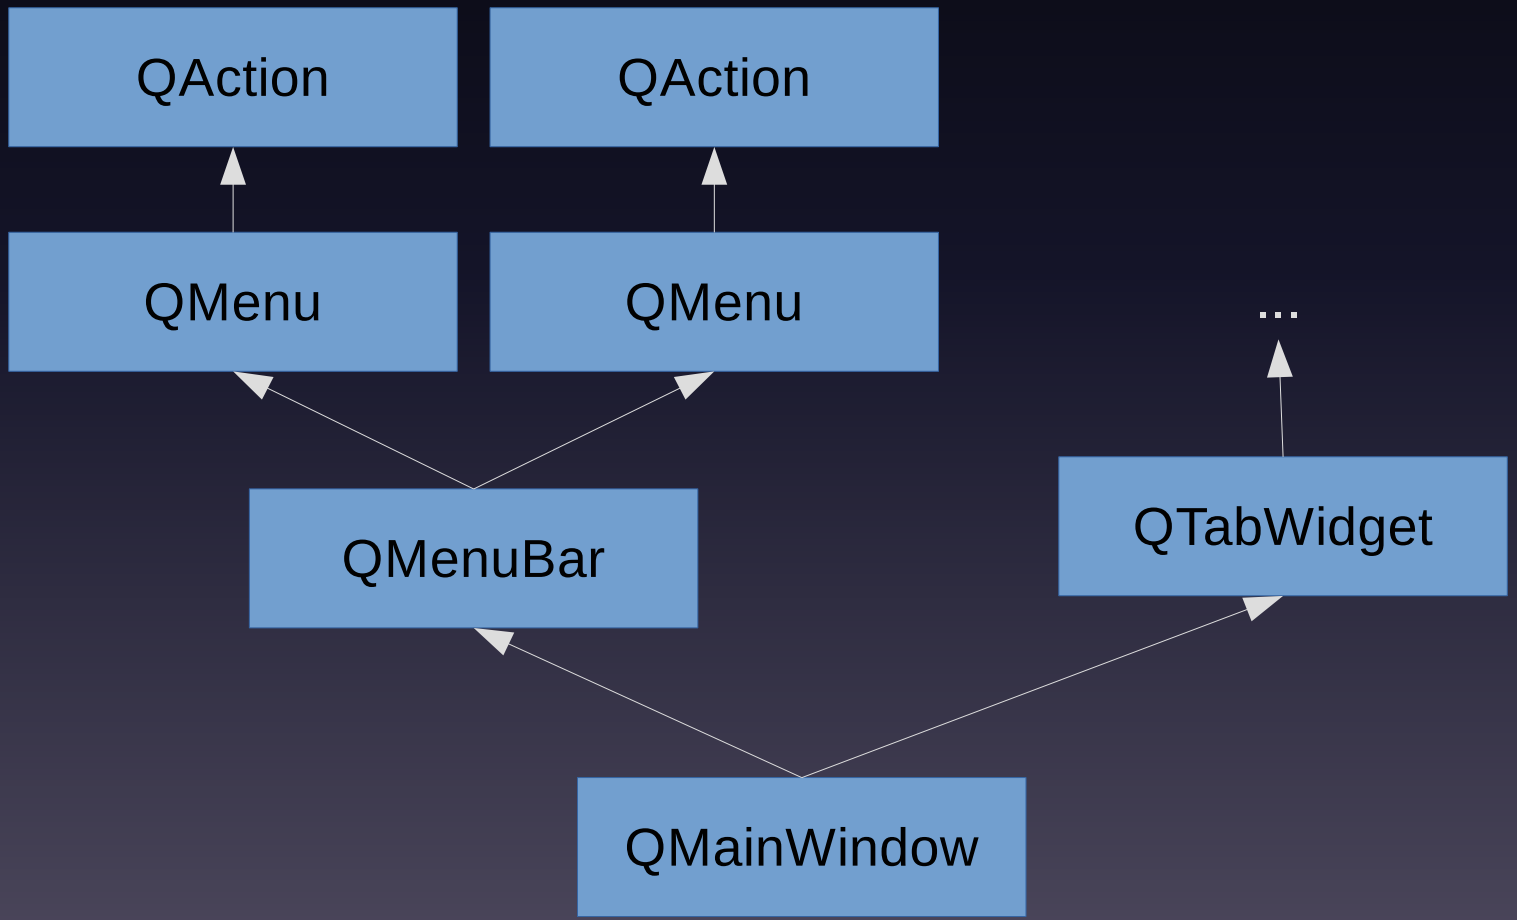
(* Most functions are polymorphic.
   No coercion needed.
   [show] needs at least a Widget *)
val show : [> qWidget] qt -> unit
```

QObjects

QObject form distinguished hierarchy of objects:

- the offer facilities for automatic and safe **memory management**
- they form a tree of ownership
- they are the only way to introduce **complex heap shapes**
- and **complex control flow**

QObjects



QAction
QAction
QMenu
QMenu
...
QMenuBar
QTabWidget
QMainWindow

QVariant

QVariant is a sum of all plain types : string + int + bool + …
It is mapped to a simple OCaml variant.
Useful to specify data models (more on that later).

Mapping Qt concepts to OCaml

Qt concepts affecting control-flow:

- methods & functions
- signals & slots
- models

Methods & functions

Methods (including static methods) are mapped to simple OCaml functions. They are put in a module named after the class:

```
module QWidget : sig
  ...
  val show : [> qWidget] qt -> unit
  val hide : [> qWidget] qt -> unit
  ...
end
```

Constructors

Constructors are very similar but they are defined in the top module and the naming differs a bit:

```
val new'QPushButton : unit -> qPushButton qt
```

Working around overloading

Qt uses and abuses overloading. Imported functions are disambiguised automatically:

```
val setFormat : string -> ...
val setFormat'1 : QColor -> ...
val setFormat'2 : QFont -> ...
```

A **curation** work is needed, to remove some variant or pick better names.

Signals and slots

The main primitive for dynamic control flow:

- a descendant of QObject can define signals and slots
- a **signal** can be connected to **slots** and **closures**
- a signal can be emitted
- the slots and closures that are connected are executed

Signals and slots

```
type (-'a, +'b) signal
type (-'a, -'b) slot

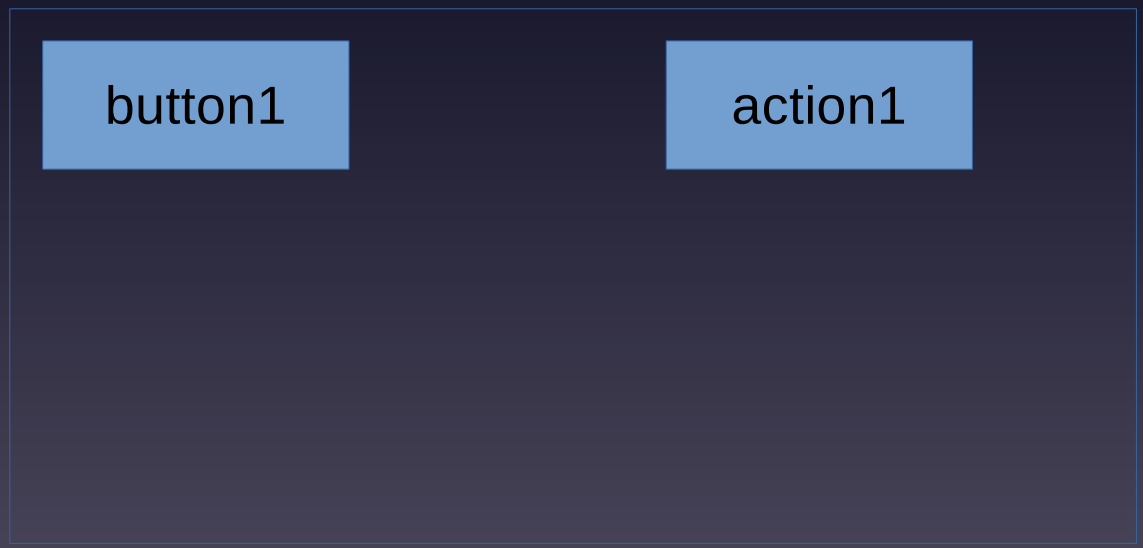
val connect_slot :  'a t -> ('a, 't) signal
                 -> 'b t -> ('b, 't) slot -> unit

val connect :  'a t -> ('a, 't) signal
            -> ('t -> unit) -> unit
```

Signals and slots

```
connect_slot button1 (QButton.signal'clicked())
             action1 (QAction.slot'trigger());

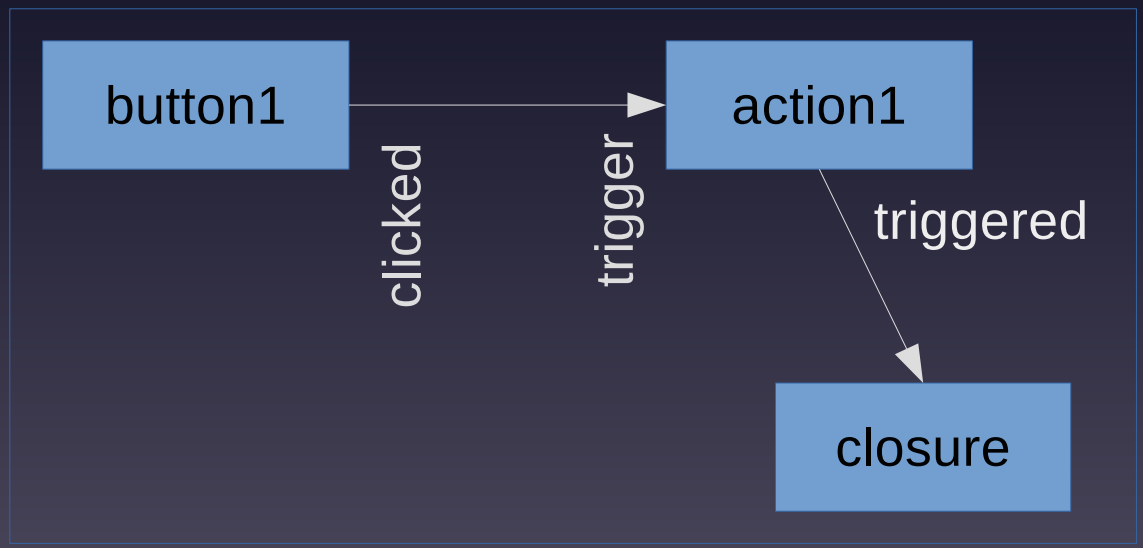
connect action1 (QAction.slot'triggered())
  (fun _ -> print_endline "Action!");
```



Signals and slots

```
connect_slot button1 (QButton.signal'clicked())
             action1 (QAction.slot'trigger());

connect action1 (QAction.slot'triggered())
  (fun _ -> print_endline "Action!");
```



Models

Models are used to specify dynamic **data source**.

An abstract model is a QObject with one or more virtual methods that define **observations on a set of data**:

- how many items
- content or display properties of each item
- structure of the items: tree-like, tabular, etc

Models

Each Model has to be encoded manually in OCaml.
The encoding is in two parts:

- the class is inherited only once on C++ side
- an instance wraps an OCaml record that contains a closure for each method

No C++ has to be written by the user :).

Models

Example:

- QOCamlTableModel
- QOCamlSyntaxHighlighter

Models

```
type 'a qOCamlSyntaxHighlighter =
  [ `QOCamlSyntaxHighlighter of 'a | qSyntaxHighlighter ]

type 'a qOCamlSyntaxHighlighter'callback = {
  highlight_block : 'a -> 'a qOCamlSyntaxHighlighter qt -> string -> unit;
}

val new'QOCamlSyntaxHighlighter :
  'a qOCamlSyntaxHighlighter'callback -> 'a -> 'a qOCamlSyntaxHighlighter qt

module OCamlSyntaxHighlighter : sig
  val setFormatColor : 'a qOCamlSyntaxHighlighter qt ->
                       int -> int -> [> qColor] qt -> unit =
end
```

Managing QObject

Four cases for memory management:

- **Relocatable objects** (plain types not mapped to a native OCaml type). Safe, automatic, don't affect graph.

Managing QObject

Four cases for memory management:

- **Relocatable objects** (plain types not mapped to a native OCaml type). Safe, automatic, don't affect graph.
- **QObject**. Safe, automatic, one region released at a time.

Managing QObject

Four cases for memory management:

- **Relocatable objects** (plain types not mapped to a native OCaml type). Safe, automatic, don't affect graph.
- **QObject**. Safe, automatic, one region released at a time.
- **Scarce resources** (e.g sockets, GPU buffers…). Safe, manual management but GC can catch mistakes.

Managing QObject

Four cases for memory management:

- **Relocatable objects** (plain types not mapped to a native OCaml type). Safe, automatic, don't affect graph.
- **QObject**. Safe, automatic, one region released at a time.
- **Scarce resources** (e.g sockets, GPU buffers…). Safe, manual management but GC can catch mistakes.
- **Raw pointers** (e.g. iterators). Unsafe, manually managed, should ideally be hidden behind an OCaml-ish abstraction

Managing QObject

Four cases for memory management:

- **Relocatable objects** (plain types not mapped to a native OCaml type). Safe, automatic, don't affect graph.
- **QObject**. Safe, automatic, one region released at a time.
- **Scarce resources** (e.g sockets, GPU buffers…). Safe, manual management but GC can catch mistakes.
- **Raw pointers** (e.g. iterators). Unsafe, manually managed, should ideally be hidden behind an OCaml-ish abstraction

Convenience/performance trade-off: when possible, release manually.

Managing QObject

One primitive for all objects :

```
val delete : _ qt -> unit
```

- release Object memory
- for QObject, also releases all children
- detect use after free
- but cannot track aliasing of raw pointers :-(

Getting started

Install qt5 and cuite package.

```
# yaourt -S qt5
# opam pin add cuite
    https://github.com/let-def/cuite.git
```

Getting started

Install qt5 and cuite package.

```
# yaourt -S qt5
# opam pin add cuite
    https://github.com/let-def/cuite.git
```

Portability not a concern yet:

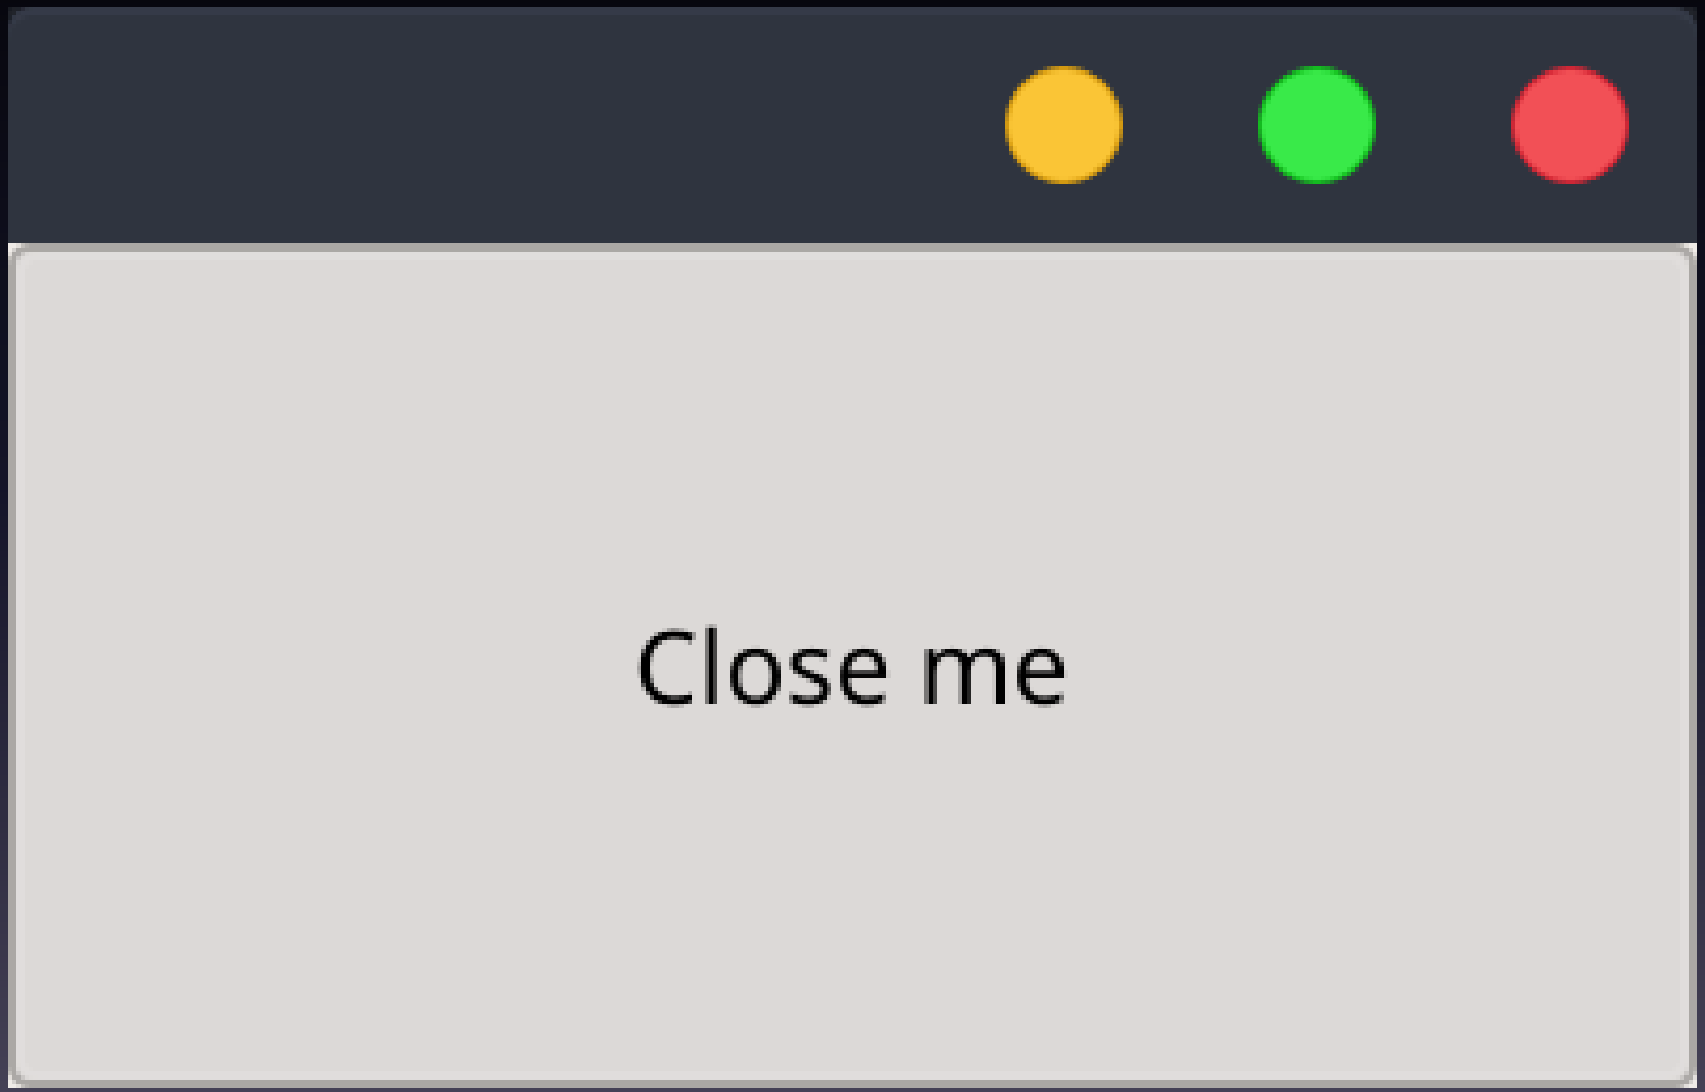
- tested only with **Qt 5.9**
- rely on **pkg-config** for finding Qt5
- rely on **g++** for compilation
- rely on **-rpath** linker option for finding dynamic libraries

Minimal example

```
open Cuite

let () =
  let app = new'QApplication Sys.argv in
  let window = new'QMainWindow None QFlags.empty in
  let button = new'QPushButton'1 "Close me" None in
  QMainWindow.setCentralWidget window button;
  Qt.connect_slot'
    button (QPushButton.signal'clicked1())
    app (Qt.slot_ignore(QApplication.slot'quit()));
  QWidget.show window;
  exit (QApplication.exec ())

# ocamlfind opt -linkpkg -package cuite -o test test.ml
```



Close me

Approach

- Manually map primitive concepts (objects, classes, methods, signals, slots, variants, …)

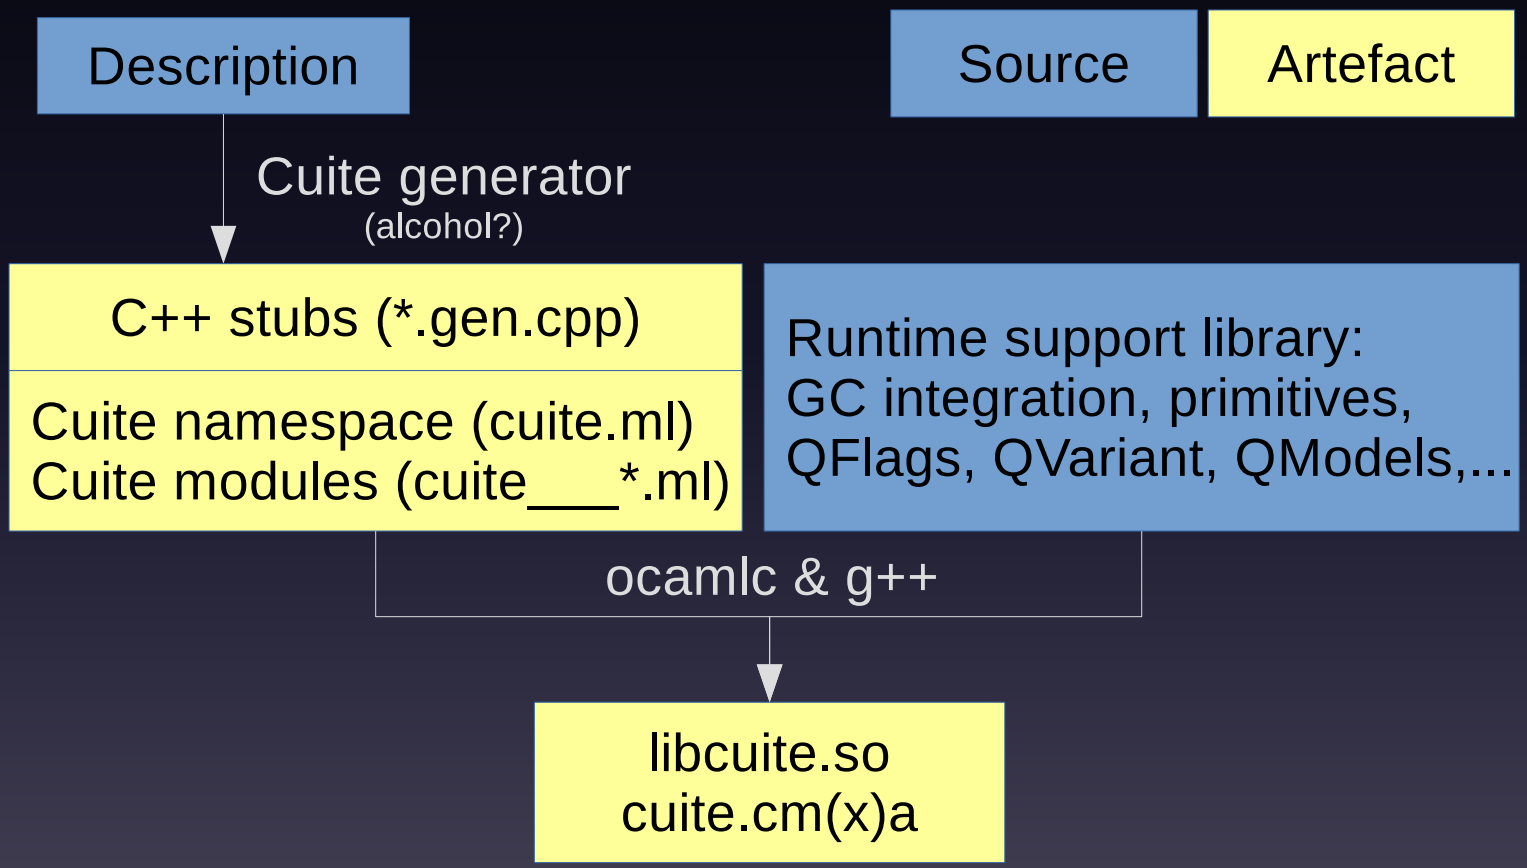
Approach

- Manually map primitive concepts (objects, classes, methods, signals, slots, variants, …)
- Automatically generate compositions of these concepts (taking an abstract description of Qt has OCaml values)

Approach

- Manually map primitive concepts (objects, classes, methods, signals, slots, variants, ...)
- Automatically generate compositions of these concepts (taking an abstract description of Qt has OCaml values)
- Manually handle corner cases (e.g models)

Automatic generation



Future work

A "proof-of-concept" has been made for each of these concepts.

Future work

A "proof-of-concept" has been made for each of these concepts.
The majority of Qt Gui/Widgets library is available…but a few crucial parts are still missing.

Future work

A "proof-of-concept" has been made for each of these concepts.
The majority of Qt Gui/Widgets library is available…but a few crucial parts are still missing.
Never ending work: too much to be handled alone, better to fix/extend as new use cases present themselves.

Future work

Things to investigate:

- Qt-designer support (seems "easy", a PPX could do)
- Lwt/Async integration
- targetting mobile platforms
- a multi-threading story?
- cleaning up ad-hoc polymorphism/overloading mess

Conclusion

Thanks for your attention!

Don't hesitate to ask for guidance if you are interested in making use of the lib or contributing.
